

# QMS Hyperline

QMS Hyperline is an innovative, high performance, alternative line marking process for the maintenance of existing road markings. For centrelines, edgelines, chevrons and hatched areas this pioneering technique improves safety on our highways without increased costs.

**Improved Safety** – Enhanced visual impact, especially at night.

**Reduced traffic disruption** – Increased productivity within restricted work areas with high-speed application equipment.

**Retro-Reflectivity** – Specially coated surface applied glass beads provide higher levels of sustainable retro-reflectivity.

**Thickness** – Application thickness avoids material build up without reducing functional life performance.

**Public & Environment Acceptability** – Solvent free with no fuel or energy heating requirement, makes it safer to use.

This environmentally friendly, high performance process is available now to revolutionise the UK highway line marking maintenance market.

Contact QMS today for a road marking condition survey and quotation.

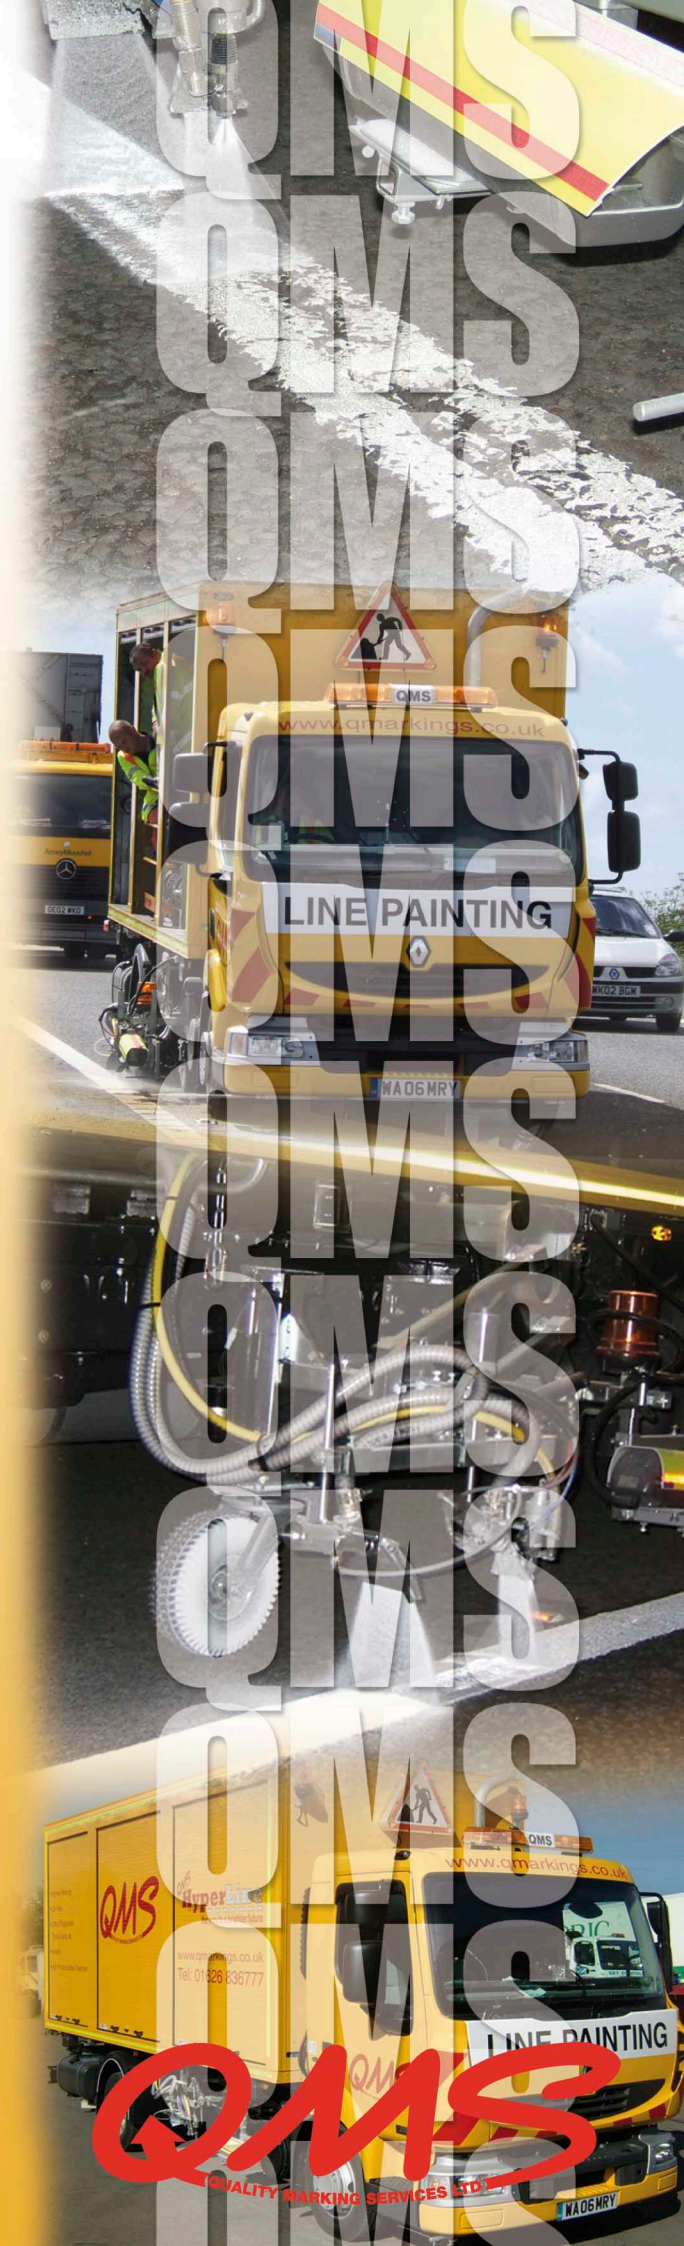

**“I was doubtful at the start (being used to thermoplastic) but over 12 months later, the lines are as reflective as the night they went down”** Parsons Brinkerhoff

**“I could not believe the speed that the lines were applied, much quicker than thermoplastic, with far greater results!”** Connect Road Operators
